On Legendrian foliations on almost $\mathcal{S}$-manifolds

Given an almost $\mathcal{S}$-manifold $(M^{2n+r}, \eta_\alpha, \xi_\alpha, \phi, g)$, $\alpha = 1, \ldots, r$, a Legendrian foliation on M is a n-dimensional integrable distribution of the $2n$-dimensional distribution $\mathcal{H} = \bigcap_{\alpha=1}^{r} \ker(\eta_\alpha)$. We attach to these foliations a connection which we call *be-Legendrian*. Using this connection we are able to find some results on characteristic classes, Ehresmann connections and projections of Legendrian foliations onto Lagrangian foliations.
